

## Sling

The Sling is used as caregiver support for positioning in bed and sitting transfers. The non-slip inner surface prevents the sling from sliding out of position, and four handles provide the caregiver a secure grip for a better working position and reduced strain. Maximum user weight: 150 kg

## Sling On

The Sling On is developed in order to facilitate the application of lift slings, for instance for heavy users, or when using a pressure relieving mattress and when the client cannot be placed on the side position. It consists of two Multiglide single sheets with handles along the sides and set together with buttons on the corners so that it doesn't slip apart. The Multiglide sheets minimize friction in the application and removal from beneath the client. Using a simple folding technique it is placed under the client without turning to the side, after which the sling is inserted between the separated sheets and easily placed into the correct position. Finally the top sheet is removed so that the lifting sling can be attached to the lift.

The Sling On is also a multipurpose transfer tool, as it can be used for other transfer situations where reduced friction underneath pressure points is needed.

IM437	Sling On large	120 x 150 cm
IM437/S	Sling On small	80 x 100 cm

## Positioning Wedge

The positioning wedges are used either alone for positioning and support or together as an additional tool for the 4Way Glide System, Multiglide, Sling On, Turning Mattress, etc to secure that the client can remain in the desired lying position. The positioning wedge gives the client a comfortable support, minimizes the strain for the caregiver to hold the client in a static position, and further frees the caregiver to perform other work, such as washing, etc. The non-slip cover prevents the wedges from sliding out of position, and is also easy to clean/wipe off.
